

# PARTICIPANTS GUIDE

# Tectonic Hackathon

Welcome to the Tectonic Hackathon! We are proud to welcome you from across 7 locations in Belgium, to work on real problems with lasting impact.

This document will provide you with more details on the challenges, using the technical partners and how to submit. Good luck!

## **Table of contents**

- 1.Challenge
  - a.KBC
  - b.SD Worx
2. Technical partners
  - a.Aikido
  - b.Eleven Labs
  - c.Cursor
  - d.Google Cloud
- 3.Submission & judging
- 4.Rules & Fair Play

# KBC Challenge

KBC is our first case partner. They are one of the largest bank in Belgium, providing banking, investment, and insurance services.

## **The Challenge**

Imagine a future where KBC perfectly understands what customers need and responds at exactly the right moment.

First, think without constraints. What would the ideal customer experience look like? Then, explore how that experience could be delivered to more than 2,300,000 customers in a scalable way.

We challenge you not to create just another feature, but to build a proof of concept for a new way in which KBC understands, supports, and guides its customers.

Consider questions such as:

1. What signals can help us understand what customers need?
2. How can customers be recognized based on their situation, behavior, and intent?
3. How can personalized experiences automatically adapt to each customer?
4. How can this work seamlessly across products, services, and channels?
5. How can you create meaningful impact for millions of customers at the same time?

## **What We're Looking For**

We're not looking for a new feature.

We're looking for a vision and a proof of concept for a scalable personalization approach that fundamentally strengthens the relationship between KBC and its customers.

**Think big. Challenge assumptions. Reimagine how a bank can understand, support, and guide customers at scale.**

# Unlock the Knowledge Within

## Find it. Understand it. Trust it.

"How might we turn fragmented organisational knowledge into a trusted shared resource?"

### 1. Welcome to the challenge

Every large organisation has a hidden superpower: the combined knowledge of its people. But that knowledge only creates value when others can use it with confidence. Too often, it is scattered, duplicated, outdated or locked away in systems, teams and individual experience. At this hackathon, your task is to explore how technology, design and human insight can turn that complexity into confidence. Build a focused proof of concept with real potential to help employees find, understand and trust what they need.

### 2. Who is SD Worx?

SD Worx helps organisations across Europe manage HR, payroll and workforce operations: the essential work that keeps people employed, paid and supported. We have been doing this for more than 80 years. Today, SD Worx brings together 10,000+ employees, serves 100,000+ customers and supports 6M+ payslips. Our operations span Europe, with payroll reach into more than 100 countries. That scale creates an extraordinary wealth of expertise. It also makes knowledge harder to navigate.

### 3. The hidden problem inside large organisations

Inside SD Worx, knowledge lives in policies, manuals, procedures, checklists and analyses. It appears in emails, chats, Teams channels and shared files. It is embedded in workflows, business applications and operational data. And some of the most valuable knowledge exists only in the heads of experts and experienced colleagues. Finding information is only the first step. A search can return ten answers. An AI assistant can summarise them. The harder question is whether an answer is reliable, current and relevant to this customer, country or situation.

### 4. Why this matters?

Across the organisation, people rely on knowledge and expertise every day to support customers, build products, improve services, ... and make informed decisions. Uncertainty slows decisions, creates repeated work and makes valuable expertise difficult to reuse. As organisations grow, more knowledge becomes available, while confidence in that knowledge can become harder to establish. This is fundamentally a trust problem. A useful solution should help people see not only an answer, but also why it deserves their confidence, where uncertainty remains and who can help when documents are not enough.

### 5. Real stories, real friction

An urgent customer question arises. An answer is needed now. An AI assistant finds three documents: one recently updated, one without an owner and one that may apply to another country. Then a colleague shares contradictory information from a Teams conversation. The employee has found information but still cannot act with confidence. A payroll consultant inherits a client portfolio. Years ago, the handover might have been one document and a one-hour conversation. Today, knowledge may be spread across documents, chats, workflows, applications, business data and experts in different teams. The information exists. Confidence does not come automatically.

### 6. Your challenge

Build a focused proof of concept that makes organisational knowledge easier to find, trust or share. Choose one meaningful problem. You do not need to solve everything.

The questions behind the challenge are simple to ask and difficult to answer: What is reliable? What is current? What applies in this context? Where are the gaps? Who has relevant expertise? Which answer should a person trust?

### 7. Inspiration Areas

- **Trust:** How might people recognise whether information is relevant and reliable?
- **Capture:** How might valuable knowledge become accessible beyond inboxes, documents and siloed teams?
- **Detect:** How might conflicting, duplicated, missing or outdated knowledge become visible?
- **Connect:** How might people find the right expertise when documents are not enough?

Use these as inspiration, not as a checklist. Do not start with prescribed technology. Start with the moment of doubt, friction or uncertainty that you want to change

### 8. Build something bold

Focus on one role, one workflow, one knowledge source or one trust signal. Make the moment of doubt tangible. Then demonstrate how your proof of concept helps someone move from "I found something" to "I understand why I can rely on it." A strong concept will make trust visible, explainable and useful.

Be curious. Challenge assumptions. Combine technical ingenuity with a deep understanding of human behaviour. The strongest ideas will not hide complexity behind a black box. They will make trust more visible, explainable and useful.

**Good luck, builders. Turn your bold ideas into real impact.**

# Aikido

We are proud to partner with Aikido, the leading software security company . As part of the Tectonic hackathon, your submission will need to have a security audit by Aikido. It will weigh **10% of your submission assessment**.

## What AI Code Audit Checks

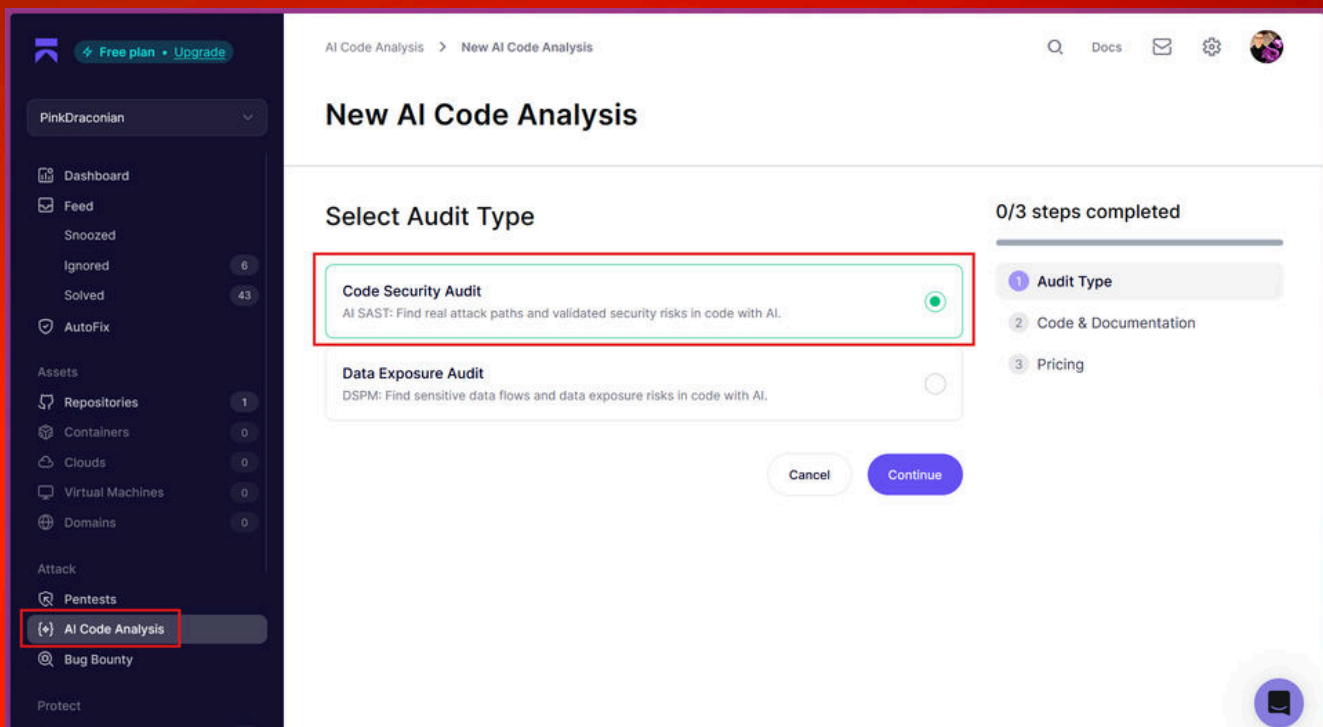

Our AI Code Audit checks for common security issues like:

- Business logic flaws: ways the application's intended rules or workflows can be bypassed or abused.
- IDOR: access to data or resources belonging to other users by manipulating IDs or references.
- Authentication: weaknesses in how users are verified
- Authorization: bad permission checks that let users perform actions or view data beyond their role.

This goes beyond standard rule-based scanning by reasoning about your code's actual logic and access patterns, not just matching known vulnerability signatures.

## How the process works

1. Visit <https://app.aikido.dev/ai-pentests/discounts/hackathon-tectonic-aikido> and create an account. Press "Continue with GitHub" to create an account
2. Connect your hackathon repo to Aikido.
3. Run the AI Code Audit (credits provided): this is your baseline scan.

4. Fix the issues found and mark them as resolved.
5. Your security score will be based on the remaining issues. Submit a screenshot of the Aikido platform before and after.

# ElevenLabs

ElevenLabs is an audio artificial intelligence company that turns written text into realistic, human-like speech and synthetic voices

## How to get your credits

1. Join the Discord server:  
[discord.com/invite/VnBvbbcdEC](https://discord.com/invite/VnBvbbcdEC)
2. Gain access to the # | coupon-codes channel
3. Click "Start Redemption"
4. Select the event and fill out the form using the email used for registration
5. The bot sends the unique coupon code.

# Cursor

Cursor is your coding agent for building ambitious software.

## How to get your credits

1. Join the Discord server:

<https://discord.gg/5UwpfTF7M>

2. Gain access to the #coupon-codes channel

3. Click 'Start Redemption'

4. Select the event and fill out the form using the email used for registration

5. The bots sends the unique coupon code.

# Google Cloud

Google Cloud is a suite of cloud computing services that runs on the same global infrastructure used by Google for products like Google Search and YouTube.

## How to get started

1. Copy the link, you find in Builderbase for your team
2. On the link, enter your email to find your GCP credentials. They are valid for 1 week only.

**Join Table: A7**  
Enter your email address to obtain your credentials for [REDACTED] Hackathon

**Team Information**  
**Table Name:** A7  
**Event:** [REDACTED] Hackathon  
**Location:** Remote  
**Date:** 2025-11-06 at 06:00

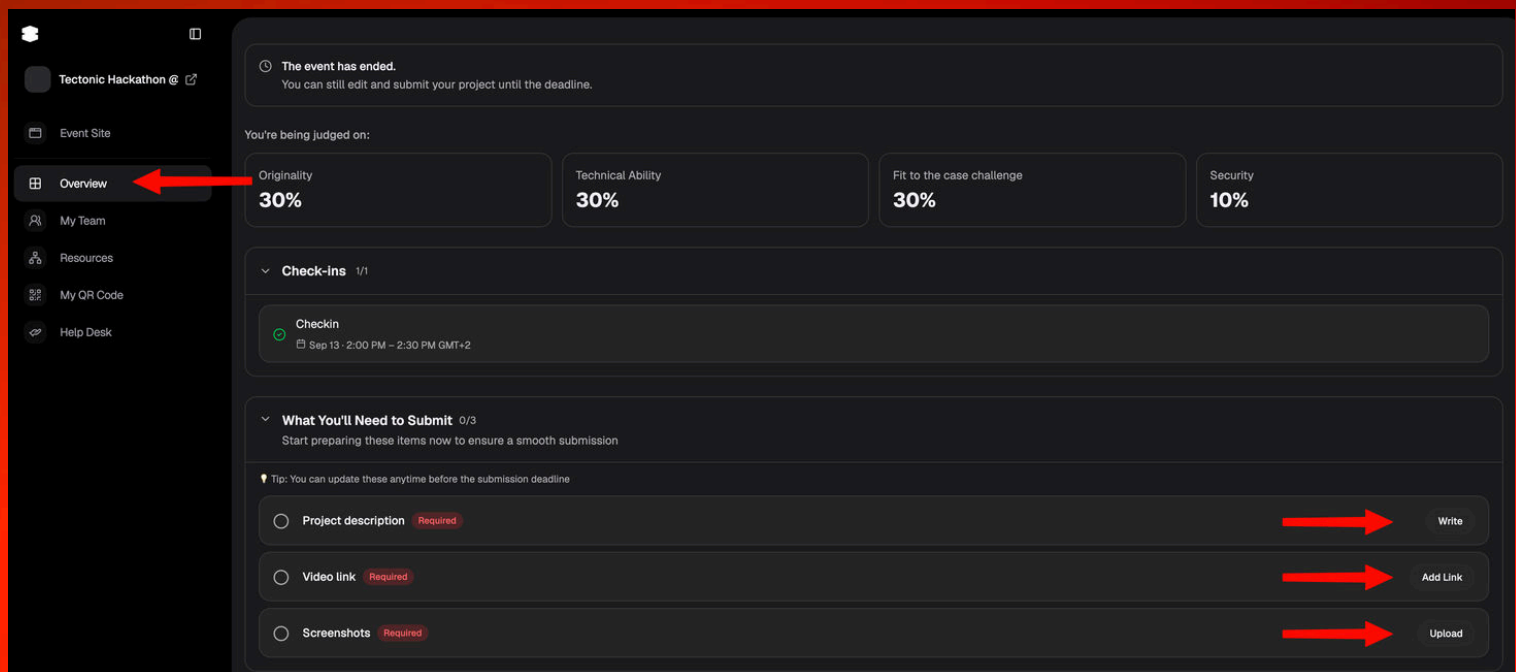

**Email Address \***

**Note:** By entering your email, you will be assigned to this team and gain access to the google cloud environment with your team's credentials.

[Access your credentials](#)

# Submission & judging

Submissions are done through the Builderbase platform. One of your team members logs in and collects the data and fills in the fields under overview. You will need to write a **short description**, make a **short demo video (<3 minutes)**, give **Github repo link** and give **screenshots of the Aikido platform**.

Our judges will score you on:

1. **Creativity:** how original is your idea?
2. **Technical ability:** does it work?
3. **Fit:** did you solve the challenge?
4. **Security:** how secure is it?

# Rules & Fair Play

- **Build within the time limit.** Your project must be built during the official hackathon time slot.
- **Submit on time.** Submit one project per team through the official platform, with all required links.
- **Final means final.** No code changes or submission edits after your final submission. Judges assess that version.
- **Keep your GitHub repository public** and accessible until judging is complete.
- **Include a short README.** Explain your project, how to run it and anything unfinished.
- **Check your links.** Judges must be able to access your repository, demo and other submitted materials.
- **Work as a team.** Collaborate with your registered teammates and take shared responsibility for your project.
- **Protect private information.** Never upload passwords, API keys or confidential data.
- **Respect everyone.** Harassment, discrimination, plagiarism and cheating are not acceptable.
- **Follow the organisers' instructions.** Judges' decisions are final. Rule violations may lead to disqualification.
